PROFESSIONAL SUMMARY

AI Full Stack Engineer with **3 years of experience** designing **agentic systems** – **LangGraph** orchestrators, **RAG** pipelines, multi-agent tool-calling loops – on top of **FastAPI** backends and **React.js** frontends, backed by **Kafka**, **PySpark**, and **AWS EKS** infrastructure. At Deloitte, built the AI and full stack for three enterprise platforms: healthcare enrollment, cost estimation, and an autonomous enrollment-file orchestrator.

SKILLS

AI / LLM	LangGraph (StateGraph, ToolNode), LangChain, OpenAI API (GPT-4.5, GPT-5), Gemini, Anthropic Claude API, RAG Pipelines (ChromaDB, hybrid BM25 + dense retrieval), Prompt Engineering, Multi-Agent Systems, Agentic Orchestration, Tool Use/MCP (Model Context Protocol), ReAct Pattern
Languages	Python, JavaScript, TypeScript, Java, SQL
Data Engineering	PySpark, Apache Kafka, AWS Glue, ETL Orchestration, Polars
Back-End	FastAPI, Node.js (Express), Django, Spring Boot
Databases & ORM	PostgreSQL, Oracle SQL, MySQL, SQLAlchemy, Prisma, Drizzle ORM
Front-End	React.js, Next.js, Angular, TypeScript, Vite, Tailwind CSS, Zustand
Cloud & DevOps	AWS (EKS, EC2, S3, Lambda, Glue), Docker, Kubernetes, CI/CD, Microservices

EXPERIENCE

Associate Engineer April 2025 – Present
Deloitte USI Bengaluru, IN

- **Member One (M1) – Agentic Enrollment Orchestrator:** Designed a **LangGraph orchestrator agent** binding **16 tools** across file management, configuration, and planning, running a cyclic **StateGraph** tool-calling loop that autonomously triages, prioritizes, and triggers enrollment file processing. Backed it with a weighted planning engine (priority, line-of-business, size, age) and a capacity-aware execution scheduler. Iterated the orchestrator's prompts across **5 revisions**, improving triage and prioritization decision accuracy by **25%**.
- Built the **Polars**-based ingestion core beneath M1: format-aware canonical parsing across **EDI 834, WCF, JSON, and XML**, plus a family-grouping algorithm that derives subscriber keys per format to keep dependents correctly linked without merging unrelated households.
- **Digital Enrollment Platform (DEP):** Built the **AI layer** (business-rule extraction, semantic guardrails, agentic enrollment validation), the **FastAPI** backend, and the **React.js** frontend (enrollment workflows, dashboards, data visualizations) for a healthcare cloud-migration PoC. The demo convinced the client to commit **\$15M**.
- **Digital Assets Framework (DAF):** Engineered the FastAPI backend, **LangGraph + OpenAI API** multi-agent reasoning pipelines, and **React.js frontend** (estimation forms, agent-output dashboards) for an enterprise estimation platform. Refactored a flat JSON store into a **normalized 5-dimensional PostgreSQL schema via SQLAlchemy**, enforcing **RBAC workflows** end-to-end.
- Built the retrieval layer on **ChromaDB** with **hybrid search** (dense OpenAI embeddings + **BM25**), and iterated agent prompts across **GPT-4.5 and GPT-5** through manual output review to improve the quality of the agent's estimation decisions.

Associate Software Engineer July 2023 – March 2025
Carelton Global Solutions Bengaluru, IN

- **MOD (Member Outbound Datalayer):** Engineered an event-driven cloud data pipeline using PySpark, AWS Glue, and Kafka to process high-volume real-time eligibility feeds, **reducing Mainframe processing time by 40%** and **boosting data accuracy by 35%**.
- **Full-Stack Modernization:** Rebuilt the customer enrollment web application with Angular and Spring Boot REST APIs, delivering a dramatically improved user experience while **reducing Oracle SQL query execution time by 25%**.
- **ETL Orchestration Automation:** Reduced new vendor onboarding lifecycle **from 3–4 weeks to 3–4 days (85% faster)** by building a configuration-driven ETL layer with PySpark, AWS Glue, and PostgreSQL, replacing error-prone manual file transfers with a self-service deployment model.

PROJECTS

Agentic Financial Advisor: Architected a stateful multi-agent financial assistant (Python, LangGraph, LangChain) by implementing a cyclic validation workflow via **StateGraph**. Designed a ReAct-based Researcher agent paired with the Google Search API for real-time market analysis, alongside a Reviewer agent that iteratively audits and self-corrects outputs (up to 3 loops) before rendering verified plans to a Streamlit chat interface. EDUCATION

Bachelor of Engineering in Computer Science, Cambridge Institute of Technology 2019 – 2023
Visvesvaraya Technological University 7.56CGPA
Relevant Coursework: Full-Stack Development, Database Management, Object-Oriented Programming, Machine Learning.
