PROFESSIONAL SUMMARY

AI Full Stack Engineer with **3 years of experience** building agentic systems end-to-end – **LangGraph** orchestrators, **RAG** pipelines, multi-agent tool-calling loops – on **FastAPI** and **React.js**, backed by **Kafka**, **PySpark**, and **AWS EKS**. Shipped three enterprise platforms at Deloitte from architecture through deployment, including a healthcare PoC that drove a **\$15M** client commitment.

SKILLS

AI / LLM	LangGraph (StateGraph, ToolNode), LangChain, OpenAI API (GPT-4.5, GPT-5), Gemini, Anthropic Claude, RAG (pgvector, ChromaDB, hybrid BM25 + dense), Prompt Engineering, Multi-Agent Systems, MCP, ReAct, Langfuse
Languages	Python, JavaScript, TypeScript, Java, SQL
Data Engineering	PySpark, Apache Kafka, AWS Glue, ETL Orchestration, Polars
Back-End	FastAPI, Node.js (Express), Django, Spring Boot
Databases	PostgreSQL (pgvector), Oracle SQL, MySQL, SQLAlchemy, Prisma, Drizzle ORM
Front-End	React.js, Next.js, Angular, TypeScript, Vite, Tailwind CSS, Zustand
Cloud & DevOps	AWS (EKS/KEDA, EC2, S3, Lambda, Glue), Docker, Kubernetes, CI/CD
Testing	pytest, Playwright, integration testing

EXPERIENCE

Associate Engineer
Deloitte USI

April 2025 – Present
Bengaluru, IN

- **Member One (M1) – Agentic Enrollment Orchestrator:** Built a **LangGraph** orchestrator binding **16 tools** across file management, configuration, and planning in a cyclic **StateGraph** loop – with a weighted planning engine (priority, line-of-business, size, age), capacity-aware execution scheduler, and custom tool-call logging for traceability. Scaled EKS pods via **KEDA** tied to queue depth rather than CPU, cutting idle overhead on burst loads. Built a **custom two-tier evals suite**: deterministic unit tests via fake stubs (no live service needed) and **18 integration behavior probes** scoring tool selection, guardrail compliance, output hygiene, and task success – plus per-case **stability scoring** to surface prompts that flip between pass and fail across runs. Used as a prompt-quality meter across **5 revisions**, lifting triage accuracy by **25%**.
- Built the **Polars** ingestion core: format-aware parsing across **EDI 834, WCF, JSON, and XML** with a family-grouping algorithm that derives subscriber keys per format to keep dependents correctly linked.
- **Digital Enrollment Platform (DEP):** Built the AI layer (business-rule extraction, semantic guardrails, agentic validation), **FastAPI** backend, and **React.js** frontend for a healthcare cloud-migration PoC driving a **\$15M** client commitment. Covered the backend with **pytest** (unit + integration) and validated enrollment flows end-to-end with **Playwright**.
- **Digital Assets Framework (DAF):** Built the **LangGraph + OpenAI** multi-agent estimation pipeline, **FastAPI** backend, and **React.js** frontend. Refactored a flat JSON store into a **normalized 5-dimensional PostgreSQL** schema with **RBAC**. Built the retrieval layer on **pgvector** with hybrid search (dense OpenAI embeddings + **BM25**), benchmarking latency and recall against ChromaDB before migrating. Integrated **Langfuse** to trace per-agent spans, tool-call latency, and token costs; iterated prompts across **GPT-4.5 and GPT-5** against fixed test cases to improve estimation quality.

Associate Software Engineer
Carelon Global Solutions

July 2023 – March 2025
Bengaluru, IN

- **MOD (Member Outbound Datalayer):** Built an event-driven pipeline (PySpark, AWS Glue, Kafka) for high-volume real-time eligibility feeds – **cut Mainframe processing time by 40%** and **lifted data accuracy by 35%**.
- **Full-Stack Modernization:** Rebuilt the enrollment app in Angular + Spring Boot; rewrote slow queries with targeted indexes (**25% faster**) and replaced bulk loads with paginated lazy views. Added **pytest** coverage across backend services.
- **ETL Orchestration:** Cut vendor onboarding **from 3–4 weeks to 3–4 days (85% faster)** with a config-driven PySpark/Glue/PostgreSQL ETL layer, replacing manual file transfers with a self-service model.

PROJECTS

Agentic Financial Advisor: Stateful multi-agent assistant (Python, LangGraph, LangChain) – cyclic **StateGraph** hard-capped at 3 review loops to prevent runaway cycles. ReAct Researcher pulls live market data via Google Search API; Reviewer audits and self-corrects before rendering to Streamlit. ([Repo Link](#))

EDUCATION

Bachelor of Engineering in Computer Science
Cambridge Institute of Technology **7.56 CGPA**

2019 – 2023

Relevant Coursework: Full-Stack Development, Database Management, Object-Oriented Programming, Machine Learning.
